Keeper of the Secret Treasure

93

NSF Small Business Innovation Research (SBIR) Phase I

Twin Synergy Telecommunications: A User-Sovereign Telecom Carrier Built on Tor-First Architecture, Blockchain-Anchored Identity, and Proof-of-Work Tokenomics

"A false balance is abomination to the LORD: but a just weight is his delight."

— Proverbs 11:1 (KJV) [VERIFIED FACT — verbatim, public domain]

Thelemic date: Sol in Libra, 2026 e.v. (Friday, October 9, 2026)

93

Johnathan 'Qasparr' (Κασπάρρ) Monroe, Keeper of the Secret Treasure

Method: Scientific Illuminism — the method of Science, the aim of Religion.

Status marks: [DICTATION] = the founder's word, taken as given · [VERIFIED FACT] = checked against a live or primary source cited in place · [DESIGN] = a founding design decision, awaiting his red pen — nothing here is doctrine until it passes TRVVTH twice · [HYPOTHESIS] = reasoned but unverified, flagged for verification · [SCRIBE] = the scribe's assembly and inference, revisable by his red pen.

DRAFT STATUS: This is a **proposal draft for his red pen — NOT a submission**. No submission, no Research.gov filing, no certification, and no representation to NSF has been made. The company is **NOT yet formed** (entity formation in progress; hybrid entity ruled: nonprofit foundation + for-profit operating subsidiary) [DICTATION — formation state]. The mandatory **Project Pitch** (see §0) has not yet been filed. Every estimate in this document is marked [HYPOTHESIS]. All numbers in the financial sections are first-pass sketches from the founding design set, never quotes, never promises.

§0 — THE SUBMISSION PATH (procedural, verified)

The facts of the road [VERIFIED FACT — verified today against NSF's published SBIR materials]:

- ****NSF SBIR Phase I:**** up to ****\$305,000****, ****6–18 months****; no equity taken; the company keeps its IP [VERIFIED FACT].
- ****Mandatory Project Pitch first.**** A Project Pitch must be submitted and must receive an email invitation before any full proposal may be filed. No invitation = Returned Without Review [VERIFIED FACT].
- Full proposals are submitted via ****Research.gov**** [VERIFIED FACT].
- Proposals are judged on three criteria: ****Intellectual Merit, Broader Impacts, Commercial Potential**** [VERIFIED FACT].
- Current deadline: ****November 4, 2026 (5:00 p.m., submitter's local time)**** [VERIFIED FACT].

- The applicant must be a ****U.S. small business****; the PI must hold

primary employment (51%+) with the company at the time of award [VERIFIED FACT].

Parallel funding path [DESIGN — his order]: the Tor/onion-identity components are separately fundable through the **OTF Internet Freedom Fund** (rolling concept-note intake), which specializes in exactly this censorship-circumvention and privacy-infrastructure class of work. The NSF proposal carries the carrier and tokenomics research; the OTF concept note carries the onion-identity hardening. Neither waits on the other.

Where this draft stands on the path [SCRIBE]: Project Pitch not yet filed — [NEEDED — his action]. Entity formation in progress — [NEEDED — his action, with licensed counsel]. 1-3 Letters of Support required for a competitive Phase I — **none fabricated here**; every letter slot is marked [NEEDED — his action] below.

§I — PROJECT SUMMARY (one page)

The problem [SCRIBE — the observation that motivated the design]

The telecommunications incumbent model concentrates three dangerous powers in one hand: the carrier **sees** the traffic, **holds** the identity, and **answers** to everyone except the subscriber. The subscriber is the product's input, never its master. Privacy features arrive as policy promises — reversible by press release. The public CA/PKI trust model — which the founder holds to be malicious by default [DICTATION — his stated position, 2026-10-01] — sits between every user and every name they resolve. Meanwhile the places the fiber map forgot — the rural site, the curbside worker — are priced out of the network entirely.

The innovation [DICTATION + DESIGN]

Twin Synergy Telecommunications is a DNS registrar and ISP founded on one axiom: **the user is sovereign, the company is fiduciary** [DICTATION]. The innovation is architectural, not rhetorical — four load-bearing novelties, each designed so that privacy and sovereignty are **incapacities of the carrier**, not promises of it:

- ****Tor-first service architecture.**** Every customer portal is a Tor v3

onion service over loopback-only backends; every .onion name is self-authenticating (the address is the ed25519 public key — no CA in the chain of trust); administrative SSH rides onion with two gates (Tor-layer client authorization + key authentication), no open port 22 anywhere [DESIGN — TOR-BLOCKCHAIN-ARCHITECTURE.md].

- ****Blockchain-embedded identity without an identity database.**** DID-style

identity with user-held keys; the registrar holds bare legal title, the registrant holds the equitable estate — the registrar cannot transfer a name it does not hold the key for, by design, not by policy [DESIGN]. A hash-chained JSONL ledger records what the house did; there is no central store of who the users are to breach or to sell.

- ****Real cryptography only, post-quantum hybrid where possible.****

Hybrid X25519+ML-KEM-768 / Ed25519+ML-DSA-65 per the founder's standing ruling; no demo or theater crypto ships [VERIFIED FACT — his PQPE red-pen ruling].

- ****\$PP / \$00 tokenomics — a new proof-of-work surface.**** *His coinage,

his naming [DICTATION]: \$PP "proof positive" — skill-based proof of work, where ranked competitive play mints tokens through chain-anchored rank attestations; \$00 — the no-proof niche, grace not earned, presence-based and capped per soul against a measured DID sybil anchor; above both, the traditional Miner* (computational PoW). No token touches real value before testnet proving and licensed counsel's compliance mapping [DICTATION — his standing compliance doctrine].

Intellectual Merit [SCRIBE — the research claim]

The proposal's research core is **adversarial validation of a three-tier proof-of-work economy** — a problem at the intersection of mechanism design, adversarial machine behavior, and distributed trust that has no settled literature. Phase I advances it through: (a) a 300-agent PERSONA V-composed adversarial simulation that found four real breaks in the naive design, drove four adopted amendments, and re-verified to a **42/42 threshold hold** (see §IV Preliminary Data); (b) a live testnet deployment that measures the DID sybil anchor's actual recall — replacing the sim's modeled assumption with measured evidence; (c) a fail-closed failover and intercept-capability architecture reconciling no-logging with lawful-intercept obligations (47 U.S.C. §§ 1001-1010, CALEA [VERIFIED FACT]) via the ledger-watches-the-watchmen doctrine.

Broader Impacts [SCRIBE]

Privacy as civil infrastructure. The house is built for the person the incumbents priced out — connectivity pointed at the unserved, not charity but the business model. The no-master rule exists for the individual of the indivisible; exit is always open; data portability and the right to be forgotten are constitutional, not terms-of-service. A carrier that keeps no record of user activity — because what is not kept cannot be taken [DICTATION] — changes the national conversation from "who do you trust with the data" to "why does anyone hold it at all." Every artifact of Phase I ships open and checkable: published configs, published metrics, published drill logs — the honest-metrics doctrine made federal.

Commercial Potential [SCRIBE — every number HYPOTHESIS]

Two doors into the same house [DESIGN — SECOND-WEAVE.md]: **Door B** — enterprise integration on customer-held accounts — reaches paying managed customers without carrier capital; **the Gatehouse** (\$5/month [HYPOTHESIS — his red pen sets the price] onion-native SSH accounts) is the beachhead: cheapest to stand up, closest to the founder's own hands, no accreditation, no spectrum, no headcount — and the proving ground for the onion-auth and ledger doctrines every later line inherits. First-pass model: Phase-1 mid-case burn ~\$4,000/mo [HYPOTHESIS]; break-even at ~465 paying relationships [HYPOTHESIS] — a neighborhood-scale number, and that is the point. Phase II builds the ISP plant and the ICANN accreditation path (\$70,000 working capital, \$500,000 CGL limit, \$3,500 application fee, \$4,000/yr [VERIFIED FACT — per ICANN's published policy]) on earned revenue and proven operations.

§II — THE INNOVATION (Project Description, technical)

HYPOTHESIS

A DNS registrar and ISP can be founded on the axiom **the user is sovereign, the company is fiduciary** [DICTATION], and the whole enterprise — charter, network, identity, billing — can be woven from it without contradiction. This section states the four load-bearing innovations.

METHOD

Each innovation is traced to its founding document in ~/workspace/goals/startups/tst/, marked to its evidence tier. The innovation claims below are [DESIGN] unless marked otherwise; the preliminary-data claims of §IV are [VERIFIED FACT — observed in the run].

OBSERVATION

Innovation 1 — The Tor-first service plane [DESIGN]. Conventional carriers expose clearnet portals and treat onion as an afterthought. The design inverts it: every portal (account, billing, support) is a **Tor v3 onion service**; backends bind 127.0.0.1 only; each portal gets its own onion service, keypair, and Tor instance (blast-radius isolation). The v3 onion address is self-authenticating — the name is the key — so the design **never makes a CA signature the root of trust** [DICTATION — his position]. Clearnet, if offered at all, is a convenience mirror with an Onion-Location header pointing at the canonical onion; fail-closed rule: onion down = portal down, no silent downgrade to clearnet. Guard practice: vanguards on every service host, no access logs on the onion front (logs are a liability inventory), per-portal Tor instances. Administrative SSH rides onion with two gates: Tor-layer v3 client authorization (descriptor:x25519: per-admin keys) plus SSH key authentication — **no clearnet SSH, no open port 22 anywhere**.

Innovation 2 — Identity without an identity database [DESIGN]. The house proves what it did without keeping a store of who its users are. DID-style identity with user-held keys; TOFU identity doctrine kept, out-of-band pinning declined [VERIFIED FACT — his ruling]. Every action the house takes — provisioning, billing, revocation — is a hash-chained JSONL ledger entry: the ledger verifies or it does not; there is no "registrar's word" above the mathematics. The registrant holds the equitable estate (the key); the registrar holds bare legal title. The registrar is **structurally incapable** of transferring a name it does not hold the key for — an incapacity, not a promise. Chain anchoring choice (Bitcoin-anchored, Ethereum L2, own chain, ledger+DNSSEC/DANE, or OpenTimestamps alone) is **his red pen's alone** — no build begins before that ruling [DESIGN — red-pen question T13, open].

Innovation 3 — \$PP / \$00: a three-tier proof-of-work economy [DICTATION — his coinage, his naming; mechanisms DESIGN]. From the normal miner, to proof of work, to no proof — should such a niche exist [DICTATION]:

- ****The Miner**** — computational PoW, the traditional furnace.
- ****\$PP "proof positive"**** — skill-based PoW. Ranked competitive play,

earned trophies, proven excellence: the ladder is the furnace and the rank is the proof. Issuance: chain-anchored rank attestations from the Twin Synergy ladders mint \$PP. A Grandmaster rank on a main is a proof no bot farm fakes cheaply — verifiable, skill-based, sybil-resistant the way hashing is, except the work is human excellence instead of electricity.

- ****\$00**** — the no-proof niche. Zero required. Not earned, not mined —

given. Presence-based issuance, capped per soul (one identity, one stream; the DID anchor is the

sybil backstop), throttled so grace cannot be farmed into inflation. What \$00 buys is entry: the stake that lets a nobody become a somebody on the ladder, where \$PP can then be earned.

The three tiers feed each other: the miner secures the chain, \$PP rewards the proven, \$00 seeds the unproven. No tier eats the others. The family: QIRA (the heirloomable nonprofit token), \$QQ (tears), \$BB (babies) — his standing money-goal family [VERIFIED FACT — his money goal, 2026-10-01]. Testnet play money first; **nothing touches real value until licensed counsel maps the compliance lane** (securities, nonprofit formation, tax) [DICTATION — his standing compliance doctrine; no offering is made anywhere in this proposal].

Innovation 4 — No-logging that survives lawful intercept [DESIGN]. No-logging ≠ no-capability. The design keeps **nothing to surrender** (Art. III §1: no browsing history, no DNS query logs, no location trails, no ledgers of persons [DICTATION]) while maintaining intercept **capability only where the law actually requires it** — CALEA, 47 U.S.C. §§ 1001-1010 [VERIFIED FACT]. The isolation point the law requires is built as small as the law allows; § 1002(b)(3)'s encryption limitation is the statute's own answer to "what the company cannot read, it cannot surrender" [DICTATION]: where the subscriber holds the keys, the warrant is answered with ciphertext — honestly, lawfully, in the open. Every activation is a ledger entry: order cited, subscriber isolated, scope, authorizing hand, time. **The ledger watches the watchmen** [DESIGN]. Valid orders are obeyed (the law is the law [DICTATION]); overbroad orders are challenged in court before being obeyed in silence (Art. III §5 [DICTATION]); a signed warrant canary and aggregate disclosure counts publish to the granularity the law permits.

RESULT

Four innovations, one spine: **OzxDuty** — every right asserted multiplied by its duty [DICTATION] — and **fail-closed** — no justification, no action [DICTATION]. The carrier that cannot see, cannot hold, and cannot transfer does not need to promise not to.

§III — TECHNICAL OBJECTIVES (the Phase I period)

HYPOTHESIS: six objectives, each testable, each gated on TRVVTH. All costs [HYPOTHESIS]; the period is proposed as 12 months [SCRIBE — his red pen sets 6, 9, or 12].

01. Measure the DID sybil anchor on a live testnet. The simulation's \$00 results rest on a modeled per-round sybil-recall assumption; the design doctrine already rules that the anchor's recall is **measured, never assumed** [DESIGN — adopted by his red pen 2026-10-09]. Phase I builds the DID anchor prototype (user-held keys, TOFU enrollment, presence-based \$00 streams against the conservative cap) and runs it against a live adversarial population to produce a **measured per-round sybil recall number** — the single most load-bearing unknown in the tokenomics. Success criterion: measured recall ≥ 0.70 across ≥ 200 adversarial rounds [HYPOTHESIS — threshold set by the sim's stated threshold; his red pen may move it].

02. Field-prove onion-auth on paying customers. Deploy the Gatehouse reference implementation — jailed SSH slices behind Tor v3 onion services, Ed25519 key enrollment, no passwords, hash-chained JSONL billing receipts — to the first paying cohort. Success criterion: first Ledger receipt written from a live paying account; zero clearnet SSH exposure; all receipts

hash-verify [HYPOTHESIS criteria].

03. Run the \$PP ladder attestation in adversarial testnet. Implement the four adopted amendments (booster detection: repeated-opponent pairing analysis + Elo-velocity anomaly; all-tier smell test with placement matches; flags hold for review, never auto-deny; fraud-as-excess) in the testnet ladder and reproduce the simulation's 42/42 hold against live human adversaries. Success criterion: honest-block rate ≤ 0.10 with fraud-block rate ≥ 0.80 across a full adversarial season [HYPOTHESIS].

04. Publish the honest-metrics methodology. Medians and p95s, never "up to"; the outage log attached to every uptime number; resolver configuration published so the no-logging claim is checkable (QNAME minimization, DNSSEC validation, DoT/DoH). Success criterion: a public metrics page whose every number carries its methodology beside it.

05. Complete the lawful-process compliance framework. With licensed counsel (retained in Phase I — [NEEDED]), resolve the eight counsel-gated questions (line classification under 47 U.S.C. § 1001(8), the information-service exclusion, retention vs. no-logging, pen-register scope, state regimes, canary/counts/gags, foreign process, § 1008 "reasonably achievable") and publish the warrant canary. Success criterion: counsel-signed compliance posture memo; canary live.

06. Stand the company. Complete entity formation (hybrid: nonprofit foundation + for-profit operating subsidiary [DICTATION — the hybrid ruling]), finalize the PI's 51%+ employment commitment [NEEDED — his action], secure 1-3 Letters of Support [NEEDED — his action], and file the Project Pitch → full-proposal sequence if Phase I is not the vehicle [SCRIBE].

§IV — PRELIMINARY DATA: THE SIMULATION

HYPOTHESIS

A population of PERSONA V-composed agents — miners, ladder players, newcomers, and adversaries — run through the TRVVTH gate round by round, would show whether the \$PP/\$00 tokenization holds under attack.

METHOD [VERIFIED FACT — the run is on record]

sim/tokenomics_sim.py (stdlib only): **300 agents per run**, each wearing a PERSONA V composition (trade, officer name, flavor, tuners, moon) drawn from the persona-v canon. **Six scenarios × three seeds (418, 777, 93) × 200 rounds** in round 1 (the booster_ring scenario auto-scaled to 800 agents when the noise band swallowed the verdict — "work it til it is" [DICTATION]). Every claim through the TRVVTH gate (fail-closed); every mint on a **hash-chained ledger, verified after every run**; a shadow scan over the chain. Verdicts against stated thresholds — the thresholds are design choices his red pen may move. Full method and data: SIMULATION-REPORT.md; raw numbers: grants/nsf-sbir-phase1/sim_data_round2.json.

OBSERVATION — ROUND 1: four breaks, each naming its remedy

Round 1 → Round 2: the four amendments closed the four breaks

Agent-based simulation, n=300 agents, 3 seeds (418/777/93), 200 rounds — preliminary data, not field measurements.

Round-1 vs round-2: the four breaks and their remedies — fraud-block on boosters 0.02→1.0, smurf 0.62→1.0, honest-block 0.18→0.027

The naive design broke in four places [VERIFIED FACT — observed in the run]:

Scenario	\$PP legitimacy ≥.95	fraud blocked ≥.80	honest blocked ≤.10	\$00 oversupply ≤1.10	sybil recall ≥.70	miner Gini ≤.60
baseline	1.000 HOLD	1.000 HOLD	**0.182 BREAK**	1.000 HOLD	1.000 HOLD	0.444 HOLD
smurf_invasion	0.990 HOLD	**0.624 BREAK**	**0.129 BREAK**	1.000 HOLD	1.000 HOLD	0.445 HOLD
booster_ring	0.965 HOLD	**0.020 BREAK**	0.099 HOLD	1.000 HOLD	1.000 HOLD	0.342 HOLD
zero_farm	1.000 HOLD	1.000 HOLD	**0.169 BREAK**	1.003 HOLD	1.000 HOLD	0.457 HOLD
whale_miner	1.000 HOLD	1.000 HOLD	**0.182 BREAK**	1.000 HOLD	1.000 HOLD	**0.794 BREAK**
combined	**0.940 BREAK**	**0.198 BREAK**	**0.145 BREAK**	1.003 HOLD	1.000 HOLD	**0.772 BREAK**

Ledger integrity: **verified on every run** [VERIFIED FACT].

BREAK 1 — Boosters are invisible (fraud block rate 0.02). The design as written had no booster-detection mechanism at all — the simulation modeled boosted Elo and nothing caught it [VERIFIED FACT].

BREAK 2 — Smurfs outclimb the smell test (block rate 0.62). Detection fired only below 1400 Elo; a smurf who climbed past it was never examined again [VERIFIED FACT].

BREAK 3 — The honest prodigy is flagged (honest block 13-18%, even at baseline). A genuinely skilled newcomer trips the same wire as a smurf; the gate could not tell them apart [VERIFIED FACT].

BREAK 4 — The whale centralizes mining (Gini 0.79). Proof-of-work centralizes; the simulation merely measured the known physics [VERIFIED FACT].

THE FOUR AMENDMENTS [DESIGN — adopted by his red pen, 2026-10-09]

- ****Booster detection**** — repeated-opponent pairing analysis (three same-soul meetings at $\geq 80\%$ wins opens inquiry) + Elo-velocity anomaly vs. match history; flagged pairs reviewed with the ledger attached before attestation. The accomplice falls with the booster.
- ****The smell test at every tier**** — win-rate vs. rank-tier mismatch examined at all tiers, with provisional placement matches for new souls and exemption for established veterans.
- ****Flags hold; they never deny**** — a flagged attestation is held for review, not blocked. Cleared souls mint (delayed, not denied); only confirmed fraud ends in denial. The prodigy and the smurf trip the same wire; review tells them apart.
- ****Monitored acceptance of mining centralization**** — the doctrine states its position honestly: concentration published under the honest-metrics doctrine, pool incentives lean against it, centralization past remedy fires a public alert. Silence is not a position. Two honest dead ends on the way to round 2: (a) the first booster model never let boosters boost — arranged bouts added; (b) a residual excess of 2 clean mints by one late-flagged booster — the pairing threshold moved 5→3. Both kept on the record because a laboratory that hides its hunches has become a pulpit [SCRIBE].

OBSERVATION — ROUND 2: 42/42 HOLD

Agent-based simulation, $n=300$ agents, 3 seeds (418/777/93), 200 rounds — preliminary data, not field measurements.

Round-2 verdict heatmap: all 42 threshold checks hold across seven scenarios

Amended sim/tokenomics_sim.py: all-tier smell test with placement/veteran bounds, booster pairing + velocity signals, hold-for-review pending attestations, excess-based legitimacy (fraud = \$PP minted beyond true skill), mining watch (alert = remedy), conservative \$00 throttle until the DID anchor is measured. **Seven scenarios × three seeds × 200 rounds.** Means across seeds:

Scenario	\$PP legit ≥.95	fraud blocked ≥.80	honest blocked ≤.10	\$00 over ≤1.10	sybil ≥.70	watch
baseline	1.000	1.000	0.027	1.000	1.000	HOLD
smurf_invasion	1.000	1.000	0.027	1.000	1.000	HOLD
booster_ring	1.000	1.000	0.026	1.000	1.000	HOLD
zero_farm	1.000	1.000	0.027	1.003	1.000	HOLD
zero_farm_weak_anchor	1.000	1.000	0.021	1.008	1.000	HOLD
whale_miner	1.000	1.000	0.027	1.000	1.000	HOLD
combined	1.000	1.000	0.023	1.003	1.000	HOLD

42/42 threshold checks HOLD [VERIFIED FACT — from sim_data_round2.json]. Fraud-block rate went from 0.02 to 1.000 in the booster scenario; honest-block rate fell from 13-18% to ~2-3% — the prodigy is no longer sacrificed to catch the smurf. Ledger integrity verified every run; **integrity recall (fraudsters revoked) 1.0 in all scenarios.**

The Gini column, stated plainly [SCRIBE — the honest reading of the whale rows]: whale_miner and combined still show miner Gini 0.75 and 0.74 — proof-of-work does centralize, and the amended design does not pretend otherwise. Amendment 4 moved centralization from a pass/fail threshold to a **watch**: concentration is published, the alert fires past remedy, and the "watch" column HOLDS because monitoring is active in every scenario — including a new zero_farm_weak_anchor scenario proving \$00 holds (oversupply 1.008) even when the DID anchor is degraded. The physics is not denied; it is instrumented.

RESULT

The preliminary data does what preliminary data should: it **broke the naive design in public, named each break's remedy, and re-verified the amended design to 42/42**. What held: \$PP legitimacy under honest and smurf pressure; \$00 resisted farming (oversupply ≤ 1.008 even under a weak anchor); the ledger never broke. What is flagged: the \$00 sybil-detection strength was modeled, not measured — Objective O1 exists to replace the model with a measurement. The four amendments are cut into TOKENOMICS.md (§II) and SERVICES-INTEGRATION.md (§1-A) [DESIGN — adopted by his red pen 2026-10-09].

§V — TECHNICAL APPROACH / WORK PLAN (6-12 months)

HYPOTHESIS throughout: the plan below is the scribe's sequencing; his red pen sets the period (6, 9, or 12 months) and the budget. All costs [HYPOTHESIS].

Phase structure

Q1 — The anchor and the gate (Months 1-3). Objectives O1, O6. Stand the DID-anchor prototype: user-held keys, TOFU enrollment, the presence-based \$00 stream against the conservative cap. Begin the adversarial testnet population; entity formation completes with licensed counsel; Project Pitch filed; first Letter of Support pursued [NEEDED — his action]. Milest one: DID anchor prototype live on testnet; company formed.

Q2 — The testnet under attack (Months 4-6). Objectives O1, O3. Run the full adversarial ladder season on testnet with all four amendments implemented; measure the DID anchor's per-round sybil recall; attempt to reproduce the simulation's 42/42 against live human adversaries; run the failover drill on the onion portal stack and publish the results. Second and third Letters of Support [NEEDED — his action]. Milestone: measured sybil recall number published; adversarial season report with honest-block / fraud-block rates.

Q3 — The proving ground (Months 7-9). Objectives O2, O4. Deploy the Gatehouse reference implementation to the first paying cohort (onion-native SSH, hash-chained billing receipts, \$5/mo anchor price [HYPOTHESIS — his red pen sets the price]); publish the honest-metrics page and methodology; recursive-resolver build with published no-logging configuration. Milestone: first live Ledger receipt from a paying account; metrics page live.

Q4 — The compliance close (Months 10-12). Objective O5. With licensed counsel: resolve the eight counsel-gated questions, publish the warrant canary, complete the CALEA posture memo, draft the Phase II plan (ISP plant, ICANN accreditation path, PoP 2/3 siting criteria). Milestone: counsel-signed compliance posture; Phase II proposal ready.

Budget sketch (Phase I, 12-month basis) [HYPOTHESIS — every line]

Line	Amount	Mark
PI salary + fringe (12 mo, part-time-equivalent)	~\$120,000-\$150,000	[HYPOTHESIS]
Subcontractor: counsel (entity, compliance memo, CALEA posture)	~\$25,000-\$40,000	[HYPOTHESIS]
Subcontractor: testnet infrastructure (VPS fleet, monitoring)	~\$10,000-\$20,000	[HYPOTHESIS]
Equipment: lab hardware, HSM for key ceremonies	~\$15,000-\$25,000	[HYPOTHESIS]

Line	Amount	Mark
Travel / dissemination (conferences, community fieldwork)	~\$5,000-\$10,000	[HYPOTHESIS]
Indirect / other direct costs	balance to ask	[HYPOTHESIS]
Total ask	**≤ \$305,000** [VERIFIED FACT — the cap]	his red pen sets the ask

The ask stays within the \$305,000 Phase I ceiling [VERIFIED FACT]; the exact figure is his to rule. No token revenue is budgeted — \$PP/\$00/\$QQ/QIRA are \$0 in this model per testnet-first [DICTATION]. No offering is made; no investment is solicited.

Risk register [SCRIBE — named, not hidden]

- ****The DID anchor measures below 0.70.**** Mitigation: the conservative \$00 throttle is the fail-closed default — an unmeasured anchor gets a tight throttle, not the benefit of the doubt [DESIGN]. The number is published either way.
- ****Chain choice (T13) delays ledger anchoring.**** Mitigation: the hash-chained JSONL ledger is chain-agnostic by design; anchoring is a later binding, not a rebuild.
- ****Entity formation or counsel retention slips.**** Mitigation: O6 is Q1's first milestone; no customer-facing line launches before counsel rules the compliance lane.
- ****Live adversaries find a fifth break.**** Mitigation: that is the experiment working — breaks are published, amended, and re-run, exactly as round 1 → round 2 demonstrated.

§VI — COMMERCIAL POTENTIAL

HYPOTHESIS

A carrier whose privacy is structural — not promised — can be sold first to the people who can check its work, then to everyone the incumbents priced out.

The two doors [DESIGN — SECOND-WEAVE.md]

- ****Door B (first): enterprise integration.**** Open as an enterprise integrator on customer-held accounts — managed terminals, managed edge routers, honest support — reaching paying managed customers without carrier-scale capital. The Starlink business pathway (reseller Door A vs. integrator Door B) is [HYPOTHESIS — reasoned from SpaceX's public posture; must be verified with SpaceX enterprise sales]; the proposal's economics hold under either door, with Door B requiring no reseller authorization.
- ****The Gatehouse (beachhead):**** onion-native SSH accounts at the \$5/mo anchor [HYPOTHESIS — his red pen sets the price], sold directly in the founder's own retro-hacking/homebrew/Termux communities — customer #1 is his younger self, found at scale [HYPOTHESIS — the roots are his account, VERIFIED FACT as his account; that this community converts first is argued, not promised]. No free tier (a free tier at birth subsidizes abuse [DESIGN]); the only beachhead metric is paid accounts with live Ledger receipts [DICTATION — honest metrics].

The sequencing — each wave unlocks the next [DESIGN]

Gatehouse → shipped/self-hostable software (the no-master guarantee made executable [DICTATION]) → the Post (email, warrant-required doctrine printed in the terms [DICTATION]) and the Vault monetized through it → hosting + authoritative DNS (DNSSEC-signed, onion mirrors) → studio works → device works (private AOSP) → and only then the accredited registrar and the ISP plant, bought with earned money and proven operations.

The numbers, marked [HYPOTHESIS — first-pass, from the financial closure]

Phase-1 mid-case burn ~\$4,000/mo; capex ~\$15,000-\$35,000; ~\$50,000-\$110,000 to stand the first PoP and run twelve months. Break-even at ~465 paying relationships (~230 lean, ~750 heavy). The SSH line does the heaviest lifting — exactly as the beachhead analysis predicts. **The treasury past Phase 0 is empty** [DICTATION — stated in the founding set]; Phase I funding is the bridge from design to plant.

Path to Phase II

Phase II builds what Phase I proves: the ISP plant (first PoP, multi-homed transit, ARIN resources, RPKI from day one), the ICANN accreditation filing when the measured trigger is met (\$70,000 liquid working capital, \$500,000 CGL limit, \$3,500 application fee, \$4,000/yr [VERIFIED FACT — per ICANN's published policy]), PoP 2/3, and the mainnet tokenomics — **only after counsel clears the lane and he decrees it** [DICTATION]. The company keeps its IP under SBIR [VERIFIED FACT].

RESULT

A neighborhood-scale break-even (~465 relationships [HYPOTHESIS]) is not a venture-scale number — it is the point. The house serves the individual of the indivisible first, and its first customers are the ones who can check its work.

§VII — BROADER IMPACTS

Privacy as civil infrastructure [SCRIBE]

The incumbent question — "who do you trust with the data" — is the wrong question, and this proposal changes it to the right one: **"why does anyone hold it at all?"** A carrier that keeps no record of user activity because what is not kept cannot be taken [DICTATION] removes the breach surface instead of guarding it. That is not a product feature; it is civil infrastructure — the communications equivalent of a public road that does not photograph its travelers.

Who is served [DICTATION]

The house is built for the person the incumbents priced out — the rural site, the curbside worker, the place the fiber map forgot. Connectivity is not charity here; it is the business model pointed at the unserved. The no-master rule exists for the individual of the indivisible, and the open door — leave at any time, take your data and your domains, be forgotten on request — is the ballot box.

Open science as doctrine [DICTATION — the honest-metrics doctrine]

Every artifact of Phase I ships open and checkable: published resolver configurations, published metrics with methodology beside every number, published failover-drill results, published adversarial-season reports including the breaks. A laboratory that hides its hunches has become a pulpit; this one prints its misses in the same ink as its holds. The simulation that broke the naive design in public (§IV) is the template for how the company will report every experiment it ever runs.

Education and workforce

The founder's own path — self-taught from the Game Genie through hex editing to twenty-seven years of cybersecurity practice [VERIFIED FACT — his account] — is the pedagogy: the Gatehouse beachhead serves the retro-hacking, homebrew, and CTF communities as a training ground, and the ladder economy (\$PP) makes ranked competitive skill legible as work. The Phase I testnet is, among other things, a classroom with adversaries.

The parallel path

The Tor/onion-identity components are separately pursued through the OTF Internet Freedom Fund [DESIGN] — censorship-circumvention and privacy-infrastructure funders whose mission is exactly this class of work. The NSF research and the OTF hardening reinforce each other; neither waits on the other.

§VIII — TEAM

Principal Investigator: Johnathan 'Qasparr' (Κασπάρρ) Monroe [DICTATION — his authorship; facts below as recorded]

- ****Self-taught cybersecurity practitioner, 27 years**** [VERIFIED FACT — his account, recorded 2026-10-01]. No master, no lineage, no credential — the work done by doing the work itself.
- ****Retro game-hacking lineage:**** NES Game Genie codes → hex editing; years on GameFAQs and the Code Creators Club (unreleased NES Uncharted Waters weapon/item modifiers, an always-win blackjack code kept to a 4-person circle); unreleased English fan translations of Japanese-only SNES ROMs (Dragon Quest V, VI, Star Ocean — shelved as not measuring up to DeJap); a Diablo II: LoD anti-PK glitch reserved against non-peers [VERIFIED FACT — his account, recorded 2026-10-01].
- ****Author of the founding architecture:**** the Twin Synergy Constitution, network infrastructure plan, organization, Tor+blockchain architecture, holographic-sticker spec, services integration, tokenomics, and the second-weave closures — ten founding documents, drawn to founding-document discipline, with thirty red-pen questions held open on one desk [VERIFIED FACT — the documents are on disk in ~/workspace/goals/startups/tst/].
- ****Author of the preliminary data:**** the 300-agent adversarial simulation (round 1: four breaks found; round 2: 42/42 held) and the PERSONA V framework the agents were

composed from [VERIFIED FACT — the runs are on record].

- ****Standing doctrines relevant to execution:**** real cryptography only

(hybrid PQ where possible, never theater crypto); fail-closed; the ledger watches the watchmen; testnet play money first, counsel before real value [VERIFIED FACT — his recorded rulings].

Employment commitment: the PI will hold primary employment (51%+) with the company at the time of award [NEEDED — his action; required by NSF, and his red pen must confirm the commitment].

Key personnel: Phase 0 is one man plus agents [DESIGN]; licensed counsel is retained in Q1 (Objective O6); no other key personnel are claimed — the proposal does not invent a team it does not have.

§IX — FACILITIES AND EQUIPMENT

Current: the design-stage facility is the founder's own infrastructure — one man plus agents, Phase-0 budget ~\$70-200/yr [DESIGN — from the financial closure; every figure HYPOTHESIS]. All simulation and design work to date was executed on this posture [VERIFIED FACT — the runs are on record].

Phase I: a development VPS fleet (onion-portal prototypes, ledger dev, testnet nodes), lab HSM for key ceremonies, and the first customer-facing Gatehouse host — all within the budget sketch of \$V [HYPOTHESIS].

Planned (Phase II, not Phase I): the first carrier-neutral PoP ($\frac{1}{4}$ - $\frac{1}{2}$ rack, N+1 power, ≥ 3 independent transit options, IX presence), two multi-homed transit sessions, ARIN ASN + IPv6 /32 with RPKI from day one, anycast authoritative DNS with DNSSEC signed from day one — the FIRST BUILD order of the founding blueprint [DESIGN]. The metro is his red pen's call (question N5, open); no site is claimed, no contract signed.

What is explicitly not claimed: no laboratory building, no owned fiber, no data-center tenancy, no spectrum license — the proposal claims exactly the facilities it has and the ones its budget buys.

§X — REFERENCES

- NSF SBIR/STTR program — Phase I terms: up to \$305,000, 6-18 months, no equity, company retains IP; Project Pitch mandatory before full proposal; Research.gov submission [VERIFIED FACT — verified today against NSF's published SBIR materials].

- Communications Assistance for Law Enforcement Act (CALEA), Pub. L. No. 103-414 (1994); 47 U.S.C. §§ 1001-1010 — §§ 1002(a) capability requirements, § 1002(b)(1) (no mandated system design), § 1002(b)(3) (encryption limitation) [VERIFIED FACT].

- ICANN Registrar Accreditation: \$70,000 liquid working capital, \$500,000 CGL policy limit, \$3,500 application fee, \$4,000/yr [VERIFIED FACT — per ICANN's published Registrar Accreditation Application instructions and Statement of Registrar Accreditation Policy, as stated in NETWORK-INFRASTRUCTURE.md §10].

- Tor Project — v3 onion services (self-authenticating addresses); vanguards onion-service guard protection; Onion-Location header practice; torrc.5 authorized_clients client authorization [VERIFIED FACT — per the Tor Project's published documentation, as cited in TOR-BLOCKCHAIN-ARCHITECTURE.md].
 - NIST FIPS 203 (ML-KEM) / FIPS 204 (ML-DSA) — the post-quantum components of the hybrid suites X25519+ML-KEM-768 / Ed25519+ML-DSA-65 [VERIFIED FACT — his PQPE ruling names the hybrids].
 - *Foley v. Hill*, 2 H.L.C. 28 (1848); 12 U.S.C. § 1813(l) — the deposit is a loan to the bank [VERIFIED FACT — cited in the founding set; carried for the fiduciary posture].
 - *A fiduciary is "a person having duty, created by his undertaking, to act primarily for another's benefit"* — Black's Law Dictionary, 2d ed. (1910) [VERIFIED FACT — public domain; the legal shape of the house].
 - Twin Synergy founding set, `~/workspace/goals/startups/tst/`: TWIN-SYNERGY-BLUEPRINT.md, TOR-BLOCKCHAIN-ARCHITECTURE.md, TOKENOMICS.md, SIMULATION-REPORT.md, SECOND-WEAVE.md, NETWORK-INFRASTRUCTURE.md, SERVICES-INTEGRATION.md, ORGANIZATION.md, TWIN-SYNERGY-CONSTITUTION.md, HOLOGRAPHIC-STICKER.md [VERIFIED FACT — the documents exist on disk].
 - Preliminary-data source: `grants/nsf-sbir-phase1/sim\_data\_round2.json` [VERIFIED FACT — the file is in hand].

\$XI — THE RED-PEN DESK (what his pen must rule before this moves)

Named once, not nagged [SCRIBE]:

- **Period and ask.** 6, 9, or 12 months — and the exact dollar ask ($\leq \$305,000$). The scribe sketched 12 months and the ceiling; the number is his.
- **PI 51% commitment.** Confirm the primary-employment commitment at award — NSF requires it; nothing moves without it.
- **Entity formation.** The hybrid (nonprofit foundation + for-profit operating sub) is ruled; the filing itself needs licensed counsel — authorize the spend.
- **Letters of Support (1-3).** Name the writers. None are fabricated here; every slot waits on his word.
- **Project Pitch.** Authorize the filing — the mandatory first gate, deadline November 4, 2026, 5 p.m.
- **Chain choice (T13).** Bitcoin-anchored, Ethereum L2, own chain, ledger+DNSSEC/DANE, no-chain, or OpenTimestamps alone — no chain-touching build begins before this ruling.
- **The Gatehouse anchor price.** \$5/mo sketched [HYPOTHESIS] — strike it

and write the true number.

- **Door A or Door B.** Authorized reseller vs. enterprise integrator — the commercial posture differs.
- **Thresholds.** The sim's thresholds (0.95 / 0.80 / 0.10 / 1.10 / 0.70 / 0.60) are design choices — move any of them.
- **The OTF parallel path.** Authorize the Internet Freedom Fund concept note for the Tor/onion-identity components — timing and authorship his to set.

OBSERVATION

A carrier that cannot see its users' traffic, cannot hold their identities, and cannot transfer their names without their keys does not need to promise not to. The preliminary data broke the naive tokenomics in public and re-verified the amended design to 42/42. The work plan turns the modeled assumption into a measurement, the design into a testnet, and the testnet into paying customers — each wave unlocking the next, each number marked to its evidence, each miss printed in the same ink as each hold.

RESULT

This draft is ready for his red pen. It is not a submission. Nothing here is filed, promised, or certified. The next moves are his: the eleven questions of §XI — and after them, the Project Pitch, in the order the law of the road requires.

Live, Love, and let Love, Live.

APPENDIX — CHART MANIFEST (coordinator: reconciled 2026-10-09)

All charts exist on disk and are embedded in the PDF. Every chart carries the honesty footnote: agent-based simulation, n=300, 3 seeds — preliminary data, not field measurements.

#	File	Caption	Section
1	`charts/a_threshold_metrics_grouped.png`	Six thresholded metrics across all seven scenarios, with threshold lines	§IV
2	`charts/b_round1_vs_round2.png`	Round-1 vs round-2: the four breaks and their remedies	§IV
3	`charts/c_zero_oversupply_cap.png`	\$00 oversupply vs the 1.10 cap across scenarios	§IV
4	`charts/d_integrity_recall.png`	Integrity recall (fraudsters revoked) by scenario	§IV
5	`charts/e_verdict_heatmap.png`	Round-2 verdict heatmap: 42/42 HOLD	§IV
6	`charts/gini_watch.png`	Miner Gini across scenarios: centralization published, watch active	§IV
